# Cree<sup>®</sup> EZ500-n<sup>™</sup> Gen 2 LED Data Sheet (Cathode-up) CxxxEZ500-Sxxx00-2

Cree's EZBright<sup>™</sup> LEDs are the next generation of solid-state LED emitters that combine highly efficient InGaN materials with Cree's proprietary optical design and device technology to deliver superior value for high-intensity LEDs. The optical design maximizes light extraction efficiency and enables a Lambertian radiation pattern. Additionally, these LEDs are die attachable with conductive epoxy, solder paste or solder preforms, as well as the flux eutectic method. These vertically structured, low forward voltage LED chips are approximately 170 microns in height. Cree's EZ<sup>™</sup> chips are tested for conformity to optical and electrical specifications. These LEDs are useful in a broad range of applications, such as general illumination, automotive lighting and LCD backlighting.

### **FEATURES**

- EZBright Power Chip LED Rf Performance
  - 450 nm 110+ mW
  - 460 nm 110+ mW
  - 470 nm 90+ mW
  - 527 nm 30+ mW
- Lambertian Radiation
- Conductive Epoxy, Solder Paste or Preforms, or Flux Eutectic Attach
- Low Forward Voltage 3.2 V typ at 150 mA
- Single Wire Bond Structure
- Dielectric Passivation Across Epi Surface

### APPLICATIONS

- General Illumination
  - Aircraft
  - Decorative Lighting
  - Task Lighting
  - Outdoor Illumination
  - Projection Lighting
- White LEDs
- Crosswalk Signals
- Backlighting
- Automotive

#### Notes:

- 1. Maximum ratings are package-dependent. The above ratings were determined using a silicone encapsulated chip on MCPCB for characterization. Ratings for other packages may differ. The junction temperature should be characterized in a specific package to determine limitations. Assembly processing temperature must not exceed 325°C (< 5 seconds). See Cree EZBright Applications Note for assembly-process information.
- All products conform to the listed minimum and maximum specifications for electrical and optical characteristics when assembled and operated at 350 mA within the maximum ratings shown above. Efficiency decreases at higher currents. Typical values given are within the range of average expected by the manufacturer in large quantities and are provided for information only. All measurements were made using a Au-plated TO header without an encapsulant. Optical characteristics measured in an integrating sphere using Illuminance E.
- 3. The maximum forward current is determined by the thermal resistance between the LED junction and ambient. It is crucial for the end-product to be designed in a manner that minimizes the thermal resistance from the LED junction to ambient in order to optimize product performance.

# Standard Bins for CxxxEZ500-Sxxx00-2

LED chips are sorted to the **radiant flux** and **dominant wavelength** bins shown. A sorted die sheet contains die from only one bin. Sorted die kit (CxxxEZ500-Sxxx00-2) orders may be filled with any or all bins (CxxxEZ500-0xxx-2) contained in the kit. All radiant flux and all dominant wavelength values shown and specified are at If = 150 mA. Radiant flux values are measured using Au-plated headers without an encapsulant.
